

Alkaline batteries can be safely disposed of with normal household waste. It is important not to dispose of large amounts of alkaline batteries in a group. Used batteries are often not completely "dead." Grouping used batteries together can bring these "live" batteries into contact with one another, creating safety risks. Never dispose of batteries in fire because they could explode.

Since 1993 most alkaline batteries contain no mercury due to concerns about mercury in municipal landfills. Alkaline batteries are composed primarily of common metals—steel, zinc, and manganese—and do not pose a health or environmental risk during normal use or disposal.
